Creating a Virtualized Infrastructure in Azure in Part 1 Azure is great for Infrastructure as a Service solutions like, but what if you want to run something completely different? In this post, we'll look at the features of Azure and how we can use them to create a Virtualized Infrastructure in Azure. In Part 2 of this article, we'll look at how Azure can be used to create an Azure Virtual Machine. In Part 3, we'll look at how to deploy and configure the features of the Microsoft Azure Virtual Appliances, including how to connect to the devices and what they offer. In Part 4 of this series, we'll look at how to create an Azure Container Service and deploy Docker containers onto an existing Azure Virtual Machine. In Part 5 of this series, we'll look at the differences between Azure Virtual Machines and Azure Virtual Appliances. In Part 6 of this series, we'll look at how to create your own Azure Virtual Machine using PowerShell. Creating a Virtualized Infrastructure in Azure Azure is a very powerful platform that offers a lot of capability for building and deploying applications. Azure Virtual Machines are the main players within Azure, offering a container-like environment inside of the Azure infrastructure. The Azure Virtual Machine allows you to provision and run applications using a Linux virtual machine and can deliver any kind of package, from bare-metal computers to containers. You can provision a new Virtual Machine or connect to an existing one from an Azure Resource Manager template. As an example of what Azure can be used for, a Virtual Machine is a powerful way to deploy an operating system or application in the cloud, without having to use a traditional on-premises infrastructure. You can
